We’ve got the world covered
Wherever you are in the world, you’ll find Meech hard at work, providing a wide range of businesses with technical expertise. From our headquarters and Technical Centre in the UK, our manufacturing subsidiary in the USA and sales offices in Belgium, Hungary, China and Singapore, we’ve got the world covered.
In fact, our distribution network now covers over 50 countries, providing easy access to fully trained, carefully selected Meech distributors, who can provide in-depth support - wherever you are based.

Outstanding quality as standard
As with every Meech system, quality is at the heart of all of our web cleaning systems. We always work to the highest possible quality standards in everything we do: manufacturing, customer support and technical know-how. Our quality management system is certified by BSI to ISO9001. Products manufactured by Meech are appropriately certified to international standards. They carry markings including CE and UL/CSA (CUL).

We also hold ATEX and UL “EX” approvals for use in hazardous environments. So, you can be sure you’ve chosen a solution and a company that will meet your own exacting standards.

World leaders in web cleaning and static control
No-one knows the specialist fields of web cleaning and static control better than Meech and the practical benefits can be seen at work. Unique design characteristics in each of our web cleaning systems, whether it is contact or non-contact, will help you to maximise the return on your investment.

All the experience you need
Established in 1907, Meech has earned a worldwide reputation for the design and manufacture of effective, durable systems that are supported by our knowledgeable technical team. With so much to offer, no wonder our global user list has grown to in excess of 7,000 companies including:

- 3M
- Amcor Flexibles
- Avery Dennison
- Colgate
- Edale
- Focus Label
- Hymmen
- Innovative Machine
- Mark Andy
- Nilpeter
- Olbrich
- OMET
- Precision Coating
- RockTenn
- Scapa
- SMI Coated
- Sotech
- Spartanics
- Superweb
- Webtech Labels
- Werosys
- WS Packaging
- Xeikon
- Zebra Technologies
Cleaning Technologies

Meech is a leading web cleaning system manufacturer with a comprehensive range of four systems. Each system is based on a different cleaning principle. Uniquely this allows us to provide our customers with a system best suited to their application.

The Meech range comprises two non-contact and two contact cleaning technologies:

- **Non-Contact**: CyClean and ShearClean
- **Contact**: TakClean and VacClean

Our range now also includes the CyClean-R, a system built on the CyClean design, which is able to run on low-tension webs, positioned around a roller.

All Meech systems incorporate the latest shockless AC static control as standard – this is crucial for comprehensive contamination removal.

Meech Web Cleaning Systems - Efficiency Comparison

The following comparison chart illustrates the cleaning efficiency (%) of the Meech range of web cleaning systems for different contamination sizes (µm).

This data has been compiled from the extensive development, testing and evaluation of our systems.

The chart is intended as a guide as there are many factors that will effect the overall cleaning performance of a system, not least, the substrate material, substrate texture, speed and application environment.
System Selection Criteria
Meech web cleaning specialists will guide you through our range of systems, identifying the one most suitable for your application and requirements.

This discussion is best completed face-to-face at the machine, however we have prepared the following questions to help you start identifying the most suitable system:

- What is the web material and speed?
- What is the critical part of the process that is driving the need for web cleaning?
- Does the application demand non-contact cleaning now or in the future, i.e. could you change the material processed on the line?
- What is the web width?
- What type of contamination needs to be removed?
- How much space is available for the cleaning head?
- Is the web under tension and at what level?

Types of Contamination
Meech systems are used to remove many types of dry and unbonded contamination from the web surface. Some common types include:

- Die cut chads
- Dust – ambient
- Dust - slitting
- Fibres
- Hair
- Insects – mosquitoes etc

![x75 magnified view of surface contamination.](image)

System Selection by Application
The table below shows which Meech web cleaning system is commonly used in some typical web cleaning applications. This table is not extensive, so if your application is not listed, please contact us to discuss which system is best suited.

Effective Cleaning
To achieve effective cleaning, a system must be able to perform three critical tasks:

1. Break the boundary layer
2. Neutralise static charges
3. Remove and trap contamination away from the web

If the web cleaning system fails to perform any one of the three tasks, effective cleaning will not be achieved.

Boundary Layer
A boundary layer of air is present on all moving webs. It is formed by ambient air that is dragged along by the moving web, no matter how slow or fast it is moving.

With a slow moving web, the boundary layer is thin. As the speed of the web increases, so does the thickness of the boundary layer.

Breaking the boundary layer is critical, as contamination is:

- Trapped directly on the web surface under the boundary layer
- Held within the boundary layer

If the boundary layer is not removed, it may be possible to remove some contamination from the web, but it will not be fully cleaned. Each Meech system uses a different technology to fully break through the boundary layer, ensuring excellent contamination removal.

The chart below shows the relationship of the boundary layer thickness (mm) to the web speed (m/min).

Static Neutralisation
A static charge will most likely be present on the web surface. Static charges are typically generated by either separation or friction. For example, a static charge will be generated as the web is unwound (separation), or as the web travels over non conductive nip rollers (friction).

Until neutralised, a static charge will trap and hold contamination already present on the web to its surface. It will also pull ambient airborne contamination to the web causing further contamination. Therefore, to achieve excellent cleaning, it is vital that the static charge is removed as part of the cleaning process.

A static charge can be either positive or negative in polarity – paper will generally have a positive charge, whereas films normally charge negatively. All Meech systems incorporate powerful AC ionising bars that will neutralise the static charge present irrespective of the polarity.

Remove and Trap Contamination
Each Meech system removes contamination from the web surface in a different way. This ensures that Meech can provide the most effective cleaning method based on the application. For example, a paper converting line requires a system that can remove high levels of typically larger sized contamination, compared to an aluminium electrode web for battery cell production that typically has fewer contaminants of a smaller size – one technology does not suit all.

The Meech CyClean, VacClean and ShearClean systems use the Meech Air Handling Unit (AHUv3). The AHUv3 is exclusively used in Meech systems to provide the airflows and filtration that traps the contaminants. The AHUv3 is supplied as standard with an F8 grade bag filter and can be upgraded to include a H14 grade HEPA filter (99.99% efficient at 0.3 micron).

The Meech TakClean system includes a consumable adhesive roll that contamination is transferred to. The adhesive roll has a high adhesive mass and contaminants are trapped on the surface. Meech supplies high and low tak adhesive rolls in either perforated or continuous forms.

CyClean™

Non-Contact Web Cleaning
The Meech CyClean has been designed in response to increased demand for a compact, high performance, non-contact web cleaning system. Through the application of advanced computational fluid dynamics, Meech has optimised the cleaning efficiency of CyClean to remove and extract contamination to below 1 micron.

A CyClean system comprises three main components; the cleaning head, active static control and an Air Handling Unit (AHUv3).

The double sided non-contact cleaning head has been designed to provide excellent contamination removal, whilst minimising any risk of web recontamination. On each side of the web there is a powerful blowing airflow that strips the boundary layer and contamination from the web surface. Two vacuum airflows catch all the turbulent air and contamination from within the cleaning head. Each CyClean head incorporates four shockless AC ionising bars; two positioned on either side of the web, one on entry to and one on exit from the head. Ionising bars ensure neutralisation of any static charges on the web that are holding contaminants to the web surface. The risk of re-attraction of contaminants to the cleaned web surfaces is also minimised.

The AHUv3 provides the airflow and filtration for CyClean.

Applications
CyClean can be used in a wide variety of applications and being non-contact means it can be used with all web materials.

Typical applications include:
- Printing; flexo, digital, gravure and ink jet
- Coating
- Laminating
- Food and medical packaging
- Specialty film processing
- Solar panel substrates
- Battery - aluminium foil
- Blister packs

Installation
The CyClean head unit can be installed at any angle without jeopardising cleaning performance. However the web must be under constant tension as it passes through the CyClean head.

For easier installation, manual opening CyClean Systems feature a unique ‘fixed ports’ system that allows the ducting connections to remain stationary when the head unit is opened. This makes installing ductwork through a machine back plate far easier.

CyClean manual opening fixed ports system
How CyClean Works

- The web passes through a cloud of ionisation on entry to the CyClean head, which neutralises any static charges.
- The web is then subject to a force of turbulent air created by the blowing and vacuum airflows within the head unit.
- High frequency micro-movements of the web are created by the turbulent air.
- The combination of the high frequency micro-movements and turbulent air shatters the web boundary air layer, releasing the contamination into the vacuum airflows.
- As the web exits the CyClean head, it passes through a second cloud of ionisation to prevent re-contamination of the web.

Design Features

The CyClean is constructed from anodised aluminium. It is a highly rigid and compact system. Based on our unrivalled experience and an extensive development program, we have included several unique features in the system.

</tbody>
</table>

CyClean Head Opening Configurations

CyClean systems for web widths up to 600mm are supplied as standard in manual opening configuration. If required this can be upgraded to pneumatic opening. Systems for widths of 601mm or greater are supplied as standard with pneumatic opening. Systems to be installed on a vertical web include guided pneumatic cylinders.

“We at Webtech were looking for a web cleaning solution on our new Gidue machine without the need for constantly changing adhesive rollers. We chose the CyClean non contact system from Meech for its robust design and excellent cleaning abilities. We are delighted with the system performance and look forward to installing more of these in the time to come. The sales and service support from their local representatives has also been a very good.”

Managing Director, Webtech Labels
CyClean-R™

Non-Contact Web Cleaning
CyClean-R is available as a single-sided cleaning system, with double-sided cleaning configurations available as an option. The CyClean-R is suitable for high-performance contamination removal from low-tension web applications. It utilises the proven CyClean cleaning philosophy of advanced computational fluid dynamics and bypasses the challenge of low tension webs by cleaning the web on a roller.

The system incorporates powerful positive and negative airflows which break the boundary layer of air on the web, efficiently releasing and removing contamination, leading to a clean surface. The airflows of the CyClean-R are controlled to optimise the cleaning performance.

CyClean-R is supplied with the latest Hyperion™ model 924IPS static control bars, to maximise the cleaning performance.

Applications
CyClean-R can be used in a wide variety of applications and as a non-contact system, it is suitable for use with all web materials.

Typical applications include:
- Printing; flexo, digital, gravure and ink jet
- Coating
- Laminating
- Food and medical packaging
- Specialty film processing
- Solar panel substrates
- Battery - aluminium foil
- Blister packs

Installation
The CyClean-R head unit is installed over a guide roller. It may be positioned at any angle to best suit the installation and will still deliver uncompromised surface cleaning. The CyClean-R overcomes tension issues, as it is designed to be positioned over a roller, where the tension in the web is naturally at its highest.

How CyClean-R Works
- The web passes through a cloud of ionisation on entry to the CyClean-R head, which neutralises any static charges on the web.

- The web is then subject to a force of turbulent air created by the blowing and vacuum airflows within the head unit.

- Due to the CyClean-R special head design and positioning, the high velocity positive and negative airflows shatter the web boundary air layer, releasing the contamination into the vacuum airflows.

- As the web exits the CyClean head, it passes through a second cloud of ionisation to prevent re-contamination of the web.
Design Features
The CyClean-R has been engineered to provide exceptional results for low-tension applications across a range of industries.

A range of opening options to suit narrow, mid and wide web applications have been developed to provide an ideal solution, considering a number of factors, including ducting access and space constraints. Our range of system configurations mean that the CyClean-R can be flexible to a number of installations, where other web cleaners may not be suitable.

At larger widths of over 1300mm, the CyClean-R includes a top manifold, the ‘carapace’. This unique design creates a robust structure that delivers enhanced support for applications up to 9000mm. In addition, the carapace also minimises the use of ducting, leading to a streamlined design.

TakClean™

Contact Web Cleaning
The Meech TakClean contact web cleaning system is designed to remove dry, unbonded contamination from a moving web.

TakClean incorporates the specially formulated TransTak elastomer contact cleaning rollers and perforated adhesive rolls which, combined, make TakClean the ultimate elastomer based web cleaning system.

Meech has designed TakClean to provide the following user advantages:

- Excellent contamination removal – removing particles as small as 0.5 micron.
- Continuous cleaning – no need to stop the web.
- Fast installation – very low downtime for installation.
- Static control – web will be contamination and static free on exit.

How TakClean Works
The unrivalled cleaning performance of TakClean is the result of 3 critical processes:

- The TransTak elastomer cleaning rollers contact the full width of the web with even pressure. Dry, unbonded contamination is lifted from the web surface.
- Pneumatics hold the adhesive roller in contact with the TransTak elastomer roller. Contamination is transferred from the surface of the TransTak elastomer roller to the adhesive roller where it is trapped.
- Any static charge present on the web is neutralised on exit from the TakClean; minimising the risk of statically attracted recontamination.

TransTak Elastomer Rollers
The specially formulated TransTak elastomer rollers are available in a variety of Shore A ratings (35 standard). TransTak rollers include cured silicone, but crucially are proven to have no ‘free chemistry’ and therefore do not leave any trace on the surface being cleaned.
Adhesive Rolls
The quality and performance of the adhesive rolls in any elastomer based web cleaning machine is vital to achieve the best levels of contamination removal.

Meech adhesive rolls are manufactured from a moisture stabilised paper base with a release coating to ensure easy unwinding. The paper is coated with an adhesive which is specially formulated to work effectively with TransTak elastomer rollers. Meech adhesive rollers have a high adhesive mass, the result of which is longer and more effective cleaning.

Meech adhesive rolls are a continuous roll of material with perforations in set positions along the length. The positioning of the perforations gives 70 easily removable (tear off) sections. The major advantages of Meech perforated rolls are:

- A knife is not required to cut the material – improved operator safety and no risk of damage to the TakClean system.
- No wasted adhesive material – the operator only removes a pre-specified length of adhesive roll material.

### Adhesive Roll Specification

<table>
<thead>

“Working with Meech is an obvious choice for Edale. It enables us to offer integrated solutions to suit our customers’ exacting needs.”

Design Office Manager, Edale
VacClean™

Contact Web Cleaning
The Meech VacClean contact web cleaning system is the ultimate system for the removal of high levels of contamination.

VacClean systems incorporate an enhanced contact cleaning manifold with either an Air Handling Unit (AHUv3) or vacuum fan unit, depending on the installation environment and web width.

Meech engineers created the VacClean manifold profile with the following design characteristics:

- Highly polished stainless steel faceplates which create turbulence to break the boundary layer
- The delta profile which is proven to have excellent airflow characteristics, ensuring that removed contamination is efficiently transferred to the system filter
- A compact web contact point that means VacClean can be installed in areas with restricted space
- Twin AC ionising bars, which are angled for an increased ionisation footprint, to neutralise static charges on the web on entry and exit to the manifold
- Brushes that aid break up of the boundary layer without contacting the web surface

For a combined manifold length up to 1,650mm/65” the VacClean is supplied with an AHUv3, which provides the airflow and filtration for the system.

A combined manifold length of 1,650mm/65” or greater requires the VacClean 3-phase centrifugal vacuum fan unit, which includes an outlet silencer and 5 micron contamination collection bag (upgradable to 1 micron).

If preferred, the vacuum fan unit is also available as an option for installations with a combined manifold length of under 1,650mm/65”.

Applications
VacClean can be used in a wide variety of applications where contact cleaning is required. Typical applications include:

- Printing
- Labelling
- Laminating
- Coating
- Slitting & winding
- Corrugating
- Food/medical packaging
- Paper making/converting
- Wood/furniture/flooring
- Automotive

Installation
The VacClean manifold/s can be installed on a web travelling at any angle without jeopardising cleaning performance. The manifold/s should be installed between rollers (typically no closer than 100mm/4”) in an area where the web remains under tension. If the system is double sided, the manifolds should be spaced by a minimum of 80mm/3”. The web must be in free air, i.e. away from rollers, conveyors or the machine bed.
How VacClean Works

- The web passes through a cloud of ionisation which neutralises any static charge present.
- The brushes just contact the surface of the material and break up the boundary layer of air, enabling effective removal of the smallest particles.
- The web then fully contacts two highly polished vacuum faceplates that give complete coverage of the web, creating highly turbulent airflows and concentrating the vacuum to remove contaminants with a very high degree of efficiency.
- As the web leaves VacClean manifold, it passes through a second cloud of ionisation to prevent re-contamination of the web.

Filtration

Excellent filtration is paramount in any web cleaning system. The VacClean system has the following standard filtration levels:

- System including AHUv3 (Compact or Standard) = F8 grade bag filter. Can be upgraded to a H14 grade HEPA filter.
- System including vacuum fan = 5 micron filter bag. Can be upgraded to a 1 micron filter bag.

Design Features

The VacClean manifold is constructed from anodised extruded aluminium making it highly rigid and suitable for single manifolds to span web widths up to 3980mm, 156". Manifolds can be joined to span wider webs.

Options

VacClean systems can be manufactured to include a range of options including:

- Vacuum fan pre filters to allow fan discharge air to be exhausted to atmosphere.
- Cyclonic dust collection.
- Acoustic enclosures to provide very low vacuum fan noise levels.

"Since installation of the VacClean system we have seen a significant reduction in slitting dust on our final product."

Technical Manager, Gascogne Paper
Non-Contact Web Cleaning
The Meech ShearClean web cleaning system is innovative and based on patented technology that utilises well established aerodynamic and fluid dynamic principles to achieve the very highest levels of cleaning efficiency without the need for physical contact.

ShearClean comprises three major components - a cleaning head, Air Handling Unit (AHUv3) and control panel. The cleaning head incorporates proprietary “non contact” cotton covered cleaning rollers and ionising bars for control of static charges. Connection to a Meech AHUv3 allows easy removal and collection of contaminants. The system is controlled and can be interlocked with the line via the control panel.

The cotton cleaning rollers operate at a high rotational velocity, typically within 1mm of the surface of the web. The roller design has been optimised to generate a high speed boundary layer of air. The greater energy of this layer destroys the boundary layer associated with the incoming web, exposing even the smallest particles resting on it to the powerful cleaning force. The low pressure, high velocity region created by the roller lifts and removes the particles from the web and carries them to the vacuum extraction chamber from which they are evacuated to the AHUv3.

Ionising bars ensure neutralisation of static charges on the web and easy breakdown of the bonds holding contaminants to the web surface. The risk of re-attraction of contaminants to the cleaned web surfaces is also minimised.

Applications
ShearClean can be used in a wide variety of applications and being non-contact it is compatible with all materials that you currently run, or may run in the future. Typical applications include:

- Specialty Films
- Labelling
- Laminating
- Printing
- Food Packaging
- Coating
- Pharmaceutical
- LCD Screens
- Filter Material

Installation
The ShearClean head unit can be installed on a web travelling at any angle without jeopardising cleaning performance. However the web must be under constant tension as it passes through the ShearClean. The head unit includes path rollers which are used to align the web between the internal cotton rollers.

The head unit can be configured to open in four configurations.
How ShearClean Works

- High speed internal rollers rotate at 4000rpm in the opposite direction to the web. This roller speed is factory set to clean webs moving at up to 600m/min (1,968ft/min) and can be adjusted for faster webs if required.

- The high speed rollers do not touch the web and there is a space of 0.5 - 1mm between each roller and the web.

- The boundary layer produced on the roller is substantially greater than the boundary layer on the web.

- ShearClean uses this superior boundary layer to strip the surface boundary layer off the web that holds the contaminants against the web surface.

- A crucial low-pressure zone is also created at the web surface. This low-pressure zone dislodges the contaminants.

- Now airborne, the contaminants are swept into the ShearClean vacuum chamber.

- An integrated aerodynamically designed ‘Shear Bar’ keeps the roller clean and prevents re-contamination of the web.

- Model 914 ionising bars with 905 power units provide effective static control to optimise the cleaning performance and prevent re-contamination of the web.

Design Features

The ShearClean is constructed from extruded anodised aluminium and stainless steel, which provides a highly rigid and compact system that can be easily installed in most applications up to a web width of 2,100mm (82”). Based on our unrivalled experience and an extensive development program, we have included several unique features in the system.

Options

ShearClean systems can be manufactured to include a range of options including:

- Gas struts to aid manual opening/closing of the head unit.
- Pneumatics to provide automated opening/closing of the head unit.
- Vacuum level monitoring for automatic control of performance.

“Since we’ve had the ShearClean it has performed fantastically well, it’s a great unit! It’s the confidence that it will remove anything in the reel, our quality control does not find any contamination on the paper, nothing gets through.”

Maintenance Engineer, Smith & McLaurin
Air Handling Units

The Meech AHUv3 range is integral to the CyClean, VacClean and ShearClean systems. The AHUv3 range includes:
- AHUv3 Mini - 1 pump
- AHUv3 Compact - 2 pump
- AHUv3 Standard - 3 pump
- AHUv3 Standard - 6 pump

The AHUv3 provides the positive and vacuum pressure airflows and houses the system filters. It is of robust design and requires minimal maintenance.

Touch Screen Control

The AHUv3 leads its class. It is fully touchscreen controlled, allowing a clear graphical display of the system settings and status, whilst also making initial setup very fast.

Interlocks and Signals

Meech engineers have provided an interlock for remote start/stop of the AHUv3 to ensure the system is always running during production. Signals for filter condition and to show the system is running are also provided.

Automatic Vacuum Pressure Control

A key feature of the AHUv3 is the Meech automatic vacuum pressure control. This feature has been designed to remove the requirement of ongoing operator adjustment - meaning the operator does not need to monitor the system until the filter condition warning signal is displayed. Critically this feature also means that a consistent level of cleaning is achieved for the full life of the filter, resulting in a consistent end product.

On Board Ionisation

The power supply for the integral ionisation system can be mounted on the rear of the AHUv3. Power for the ionisation power supply is taken directly from the AHUv3, meaning only one main electrical supply is required for the system installation.
Filtration
Excellent filtration is paramount in any web cleaning system. The Meech AHUv3 range has two levels of filtration:

- **F8 Grade Bag Filter**
  - Efficiency of 90-95% at 0.4µ or 100% at 1µ
  - AHUv3 Compact surface area: 0.7m²
  - AHUv3 3 and 6 pump surface area: 2m²

- **H14 Grade HEPA Filter**
  - Efficiency of 99.997% at 0.3µ
  - AHUv3 Compact surface area: 4.5m².
  - AHUv3 3 and 6 pump surface area: 7.5m²

**Filter Capacity Increase**
The filter capacity of the Meech AHUv3 range can be increased by adding an optional inline filter unit. This unit is installed as a pre-filter to the AHUv3 and includes one additional F8 grade bag filter.

**AHUv3 Sizing Guide**
The following table shows which AHUv3 model is used with each system by web width.

Werosys
Chief Technical Officer

"Werosys selected the Meech CyClean non-contact system for our converting lines to give our clients a fully integrated Web Cleaning solution with no need for daily operator attention. The solution provides a consistent cleaning result and will alert the operator if maintenance is required. By integrating the Meech control system with the machine control system, we can remotely monitor the complete installation and provide real-time support."

Mark Andy
Sales Director Europe

"We specify Meech web cleaning systems on our full range of presses. We selected Meech as it was clear their expertise in web cleaning and related applications matched our high level of knowledge – we can really discuss specific applications with Meech. Our preference is the CyClean non-contact system, but we know Meech has three other technologies on hand if needed. An added benefit is that we also work with Meech for static control, meaning we have a complete ‘clean press’ solution from one partner. Mark Andy and Meech are premium manufacturers and we are both committed to minimising contamination on a press."
"As an innovator in digital-printing technology, Xeikon is committed to delivering web-fed digital colour presses of the highest quality, which also means ensuring that our presses are spotless. For this reason, we wanted to partner with a company that understood the importance of minimising contamination and could supply web-cleaning systems that delivered on their promise. Meech ticks both of those boxes."

"Spartanics has partnered with Meech to integrate their Double-Sided TakClean Contact Web Cleaning System with Static Control into our web handling systems used in printing and coating applications. Effective web cleaning, ease of maintenance/roll changes, and cost effective, compact, stylish design are the attributes that make the Meech TakClean a successful web cleaning solution within our products."
CyClean-R: Narrow Web - End Feed - Fixed - Single Sided

To Suit 0001-0200mm Max Web Width

**Demonstration and Test Facility**

Meech has a web cleaning demonstration and test facility at our head office in the UK and at our USA and China offices. These facilities allow our customers to gain first hand experience of the four Meech web cleaning technologies. Customers can bring their own sample material and see the different cleaning levels that can be achieved by each system, allowing the most suitable system for the material to be identified and cleaning performance validated.

Our demonstration and test facilities are also used to train the Meech team and our network of distributors so that you can be sure your Meech partner understands our systems and your needs.

**Test Material**

If you would like us to test your material, please ensure it meets the following size criteria:

- Web width = 300mm max (12”)
- Core diameter = 76mm (3”)
- Roll diameter = 450mm max (18”)

---

**Image**: Demonstration and test facility equipment. Customers can bring their own sample material and see the different cleaning levels achieved by each system.
All you need, from the best in the business

Meech is also a leading provider of:

- **Industrial Static Control Systems** – Eliminating unwanted static or creating a controlled static charge in industrial processes can increase productivity, reduce waste and enhance quality.

- **ESD** – High sensitivity static control for electronic cleanroom environments to prevent ESD damage and reduce failure rates.

- **Air Technology Equipment** – Compressed air products that save energy, reduce noise levels and provide efficient cooling.

- **JetStream Air Knife Systems** – Energy efficient air knife systems that are used for contamination and surface moisture removal.

- **IonRinse** – Energy efficient ionising air rinsing system for the beverage, food and pharmaceutical processes.
